To assess the attitudes, knowledge, and skills of the medical profession in the treatment of rheumatoid arthritis. A questionnaire was distributed to 267 physicians (mean age 52 years; 61% female) representing the US medical community. The survey revealed that there is a need for increased education in the management of rheumatoid arthritis. Some important educational gaps were identified including: (1) a lack of recognition of the prevalence of rheumatoid arthritis, (2) a lack of knowledge regarding the etiology of the disease, (3) poor awareness of current treatment guidelines, (4) a lack of systematic rheumatoid arthritis review during the office visit, and (5) a lack of documented interactions with rheumatologists or rheumatology specialists. Of the respondents, 82% thought it was somewhat important or extremely important for rheumatologists to assess patients' knowledge of their disease, and 95% agreed that improving patient knowledge of their disease is important. A majority of respondents (85%) disagreed that the management of rheumatoid arthritis should be the responsibility of primary care physicians. As the disease progresses, the respondents reported that the information they get from rheumatologists and rheumatology specialists becomes less important. The respondents showed a high level of awareness regarding treatment recommendations for rheumatoid arthritis. However, a significant gap exists between the level of awareness of the respondents and the guidelines as determined by their own journals. This study identified important gaps in the knowledge and skills of the medical profession in the management of rheumatoid arthritis, and underlined the need for improved medical education for this disease.Q: What does @ mean in Bash?
