Myasthenia gravis is a relatively uncommon autoimmune disorder which affects the neuromuscular junction. With an incidence of 1-3/100,000, myasthenia is less common than other autoimmune disorders such as pernicious anemia, Addison's disease, and thyroiditis. Myasthenia is thought to be a result of an autoimmune response to the acetylcholine receptor in the post-synaptic region. There are two primary forms of myasthenia: the ocular and generalized form. Clinical manifestations usually appear in the early thirties and may start in childhood. Diagnosis is largely based on clinical features and need not be supported by laboratory or electrophysiologic tests. Treatment is aimed at the underlying condition and often involves agents which can reduce the acetylcholine receptor synthesis or enhance receptor breakdown. Therapy is highly dependent on the clinical state of the patient, and there are several different medications which may be used alone or in combination. A relatively new drug, neostigmine, may have a role in the management of difficult cases./ \* \* Copyright (c) Microsoft Corporation \* \* All rights reserved. \* \* MIT License \* \* Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated \* documentation files (the "Software"), to deal in the Software
