hi all, I want to know how to navigate to desktop on terminal. for example, to open home folder: i should navigate to desktop and copy home folder then paste it again in terminal. but I don't know how to do that. I am very beginner on linux. A: Is /home should give a list of your current home folders: \$ ls /home . Desktop Downloads Downloads Downloads Documents Downloads Music New Mail Photos Public Shared If you want to navigate to the home folder: \$ cd ~/ If you want to navigate to the Desktop: \$ cd Desktop Q: How can I test if my Entity Framework 6 entity model is up to date? I have to implement a new feature that requires me to update my entity model manually. Unfortunately, I've inherited a large (and I mean HUGE) EF6 model that is maintained in a sloppily developed state by people whose main focus is on UI changes. It seems to work, but is very loosely coupled and has issues, and I'd like to solve these issues. I'm thinking that one way to do this could be to write a utility that would start an update of the model, and if it fails, report the potential issues in a manner that would allow my people to resolve them, perhaps with a "Hit Rebuild" button that would do just that, or something similarly simple. How can I do this with a minimal amount of overhead? A: You can create a test project that will test all entities and then migrate that database to a new database. I use EF 4.1 and DbContext with a small extension: public static class MyTestDatabase { public static void Initialize() { using (var db = new DbContext()) { db.Database.Initialize(false); } } public static void SeedData(this MyTestDatabase db) { db.Appointments.Add(new Appointment()); db.Appointments.Add(new Appointment());
