Does anyone know the simian pro coding for the buttons, I have been trying.A gas turbine engine has traditionally been used as the main power source for an aircraft. However, it has also been proposed to combine a gas turbine engine with a steam turbine engine in order to achieve an intermediate thrust/weight ratio. Such an arrangement is disclosed in U.S. Pat. No. 6,249,529 (Campbell). The integration of gas and steam turbine engines can be achieved by using a shared turbo-machine, in which the turbines can interconnect directly with the gas path by using a bypass duct. This way, a high pressure turbine (HPT) gas turbine can drive a shared low pressure turbine (LPT) which in turn drives a common low pressure fan. In the turbofan application, the LPT connects with the fan through a high pressure shaft (HPS) which may be coaxial with the HPT or a separate shaft. The HPS drives the fan and also provides a drive for compressor associated equipment. It is desirable to increase the efficiency of the turbofan by increasing the temperature of the air flowing through the bypass duct. As the flow velocity through the duct is increased, the pressure difference between the duct outlet and the inlet is increased, which in turn results in an increase in pressure and temperature at the fan inlet. In the case of turbofan application, the hot compressor outlet gas is channeled directly through the LPT and into the fan bypass duct. However, the temperature of the gas exiting the compressor is relatively low and therefore the temperature of the air flowing through the LPT is limited by the melting point of the duct material. Moreover, it may not be possible to increase the temperature of the air flowing through the bypass duct to the fan in
